## 1.2. Project description

The overarching goal of this SCCF-financed project (referred to as the “CityAdapt” project) is to build the climate resilience of urban and peri-urban communities living in cities in the LAC region through the implementation of EbA approaches. The objective of the project is to increase the capacity of government and local communities living in three medium-sized LAC cities, namely San Salvador in El Salvador, Xalapa in Mexico and Kingston in Jamaica, to adapt to the effects of climate change through the integration of EbA into urban planning in the medium- to long-term.

The project, implemented by the United Nations Environment Programme (UNEP), builds on several baseline projects (both national and regional), and is executed by UNEP’s Office for Latin America and the Caribbean (ROLAC) in collaboration with the Ministry of Environment and Natural Resources (MARN) in El Salvador, the Ministry of Economic Growth and Job Creation (MEGJC)<sup>1</sup> in Jamaica and the Secretariat of Environment and Natural Resources (SEMARNAT) in Mexico.

**Component 1** aims at mainstreaming urban Ecosystem-based Adaptation (EbA) into medium- and long-term urban development planning. The activities under this component seek to propose revisions to relevant national and sub-national plans and strategies to incorporate urban EbA approaches, as well as to train local stakeholders to integrate climate change indicators in their planning processes. Through these lessons learnt, upscaling strategies are developed to extend the revised plans, strategies and successful experiences to other cities in the LAC region.

**Component 2** aims at implementing urban EbA interventions to foster climate-resilient communities. These interventions: i) reduce runoff and enhance infiltration of rainfall at watershed scale by constructing vegetated infiltration ditches (in San Salvador and Xalapa) and restoring vegetation (in the three cities); ii) contribute to enhanced water storage capacity through wetland rehabilitation (in Kingston) and the creation of natural storage points for excess water (in San Salvador and Xalapa); iii) increase water quality and availability at household level for washing and irrigation of gardens by implementing a solid waste management system (in San Salvador and Jamaica) and; iv) implement rainwater harvesting schemes (in all three cities). This addresses urban communities’ vulnerabilities identified during a vulnerability assessment conducted in each city, most of them related to flooding as a result of increased rainfall, and water shortages as a result of more frequent and prolonged droughts. Interventions are complemented by capacity building activities, including training on climate-resilient livelihoods, and the drafting of protocols to implement, monitor and maintain the EbA interventions.

**Component 3** aims at acquiring knowledge and raising awareness of urban EbA throughout the LAC region. Through social media campaigns and tailored communication tools and materials (including educational toolkits, games, children and adults’ guidebooks, webinars, videos and virtual tools etc.), the CityAdapt project increases the awareness of the urban communities on climate change and the benefits of EbA approaches to adapt to the effects of climate change. This knowledge component also includes the development of a long-term research programme with national research institutions to monitor the benefits of the implemented urban EbA interventions. The research institutions include the University of El Salvador and the Catholic University - UCA (San Salvador), the University of the West Indies (Kingston), and the Institute of Ecology, Universidad Veracruzana and the Superior Technology Institute of Xalapa (Xalapa).

| PIR #  | 1 <sup>st</sup> PIR | 2 <sup>nd</sup> PIR | 3 <sup>rd</sup> PIR | 4 <sup>th</sup> PIR | 5 <sup>th</sup> PIR | 6 <sup>th</sup> PIR | 7 <sup>th</sup> PIR |
| Rating towards <b>outcomes (DO)</b><br>(section 3.1) | MS                  | MS                  | S                   | S                   | S                   | S                   | HS                  |
| Rating towards <b>outputs (IP)</b><br>(section 3.2)  | MS                  | MS                  | MS                  | S                   | S                   | S                   | S                   |

|                           |   |   |   |   |   |   |   |
|---------------------------|---|---|---|---|---|---|---|
| Risk rating (section 4.2) | M | M | M | M | M | M | M |
|---------------------------|---|---|---|---|---|---|---|

**Rating towards outcomes:** The rating towards outcomes is highly satisfactory, as the project has now finished its implementation, reaching its objectives and exceeding many of the outcome indicator targets, of which more than half are rated “highly satisfactory” (and the rest “satisfactory”) (see Section 3.1). While activities had mainly been concluded in the last reporting period in Mexico and El Salvador, some last support was provided to the academic research and scaling up activities in both countries; in Jamaica, emphasis was given to finishing implementation, and completing pilot interventions, knowledge products, and capacity building. All project activities have now been completed in all three countries, while the project is under operational closure to finalize all outstanding payments and closing procedures.

The draft Terminal Review (TR) of the provides a similar rating of the project’s achievements, rating the criterion of “effectiveness” as highly satisfactory, and specifically the achievement of outcomes also as highly satisfactory. The consultant team undertook its evaluation under this reporting period, with fields visit in Mexico and El Salvador in September 2023, and in Jamaica in December 2023.

Under **Component 1**, the finalization of the vulnerability assessments in Xalapa and San Salvador in previous reporting periods, and in Kingston under this reporting period, provided an opportunity to build institutional capacities and coordination: outreach materials were developed to disseminate these results and opportunities were identified to update the vulnerability assessments, such as the added climate change scenarios for San Salvador and the inclusion of this analysis in the national adaptation plan process being carried out in El Salvador and in Jamaica. Trainings of key decision-makers were previously expanded to other municipalities in all three countries to ensure capacity building and proper understanding of the content of these analyses; this includes contributions to a six-month training programme called the NbS accelerator, with 16 Mexican States. A regional technical guideline on NbS implementation was produced under previous reporting periods based on the trainings and lessons learnt from all three cities, as well as two regional policy briefs on the lessons learnt in terms of sustainable financing for NbS and mainstreaming of NbS into local planning that were translated and finalized under this reporting period. This complements the policy briefs elaborated and finalized in Xalapa, San Salvador and Kingston.

In this reporting period, a special emphasis was given to capacity building in Jamaica, with the finalization of all the training materials and the institutionalization of this training in diverse university and academic institutions of the country. The policy briefs were designed and published, while the guidelines provide a wide range of understanding of both water and land management in urban areas, through an NbS scope of Sustainable Urban Drainage System and urban planting. This also complemented ongoing upscaling efforts, with the finalization of the upscaling strategy in Jamaica and the follow-up and further development of the concept notes developed in the other two countries. The lessons learnt from Xalapa served in the expansion of the new CityAdapt 2.0 project proposal, that is currently being submitted to the GCF and that required consultations and participatory process in other Mexican cities, thus expanding the knowledge on urban adaptation. In El Salvador, with the approval of the pre-concept note for the regional project proposal to the Adaptation Fund (AF) in March 2023, the project team continued the drafting of the concept note, that obtained technical clearance in May 2024 – expecting its approval in the next board AF Board meeting (B-43).

Regarding EbA pilot interventions under **Component 2**, while they were temporarily halted or delayed due to COVID-19 related restrictions in previous reporting periods, their implementation was finalized in Xalapa and San Salvador under the previous reporting period, and in Kingston under this reporting period.

All three cities have finalized the reforestation and restoration activities. San Salvador restored close to 55,198 lineal meters of vegetated infiltration ditches and 1,161 hectares of coffee plantations and built 30 absorption wells, which increase vegetation cover in key areas for water and soil retention and improve surface water infiltration. This is in addition to the 489 fruit trees distributed to communities and the 5.1km of riparian restoration.

Xalapa finalized the ecological restoration of the Estropajo hill (6,361 plants of 42 species, as previously reported), which was executed with an upscaling strategy called “one tree per household” that led to the planting of more than 600 additional trees, adopted by families in the peri-urban area of Xalapa. This was complemented by the design and implementation of the training strategy in urban agroecology, which also

served as a sustainability strategy for the riparian restoration along the Papas urban river (3,706 plants sown, as previously reported). The environmental restoration and the construction of infiltration trails to improve the hydrological dynamics of the natural wetland within the Molino de San Roque Natural Protected Area was also implemented and finalized, along with a series of workshops to help strengthen the capacities of 24 municipalities in the states of Veracruz and Tlaxcala. The edible mushroom activity reached a total of 10 plots and was complemented by 16.8 hectares of land put under agrosilvopastoral management.

Kingston had previously completed the planting of 10,875 trees and the planting of 1,563 seedlings for the rehabilitation of 2.3 hectares in the upper watershed of the city. Additionally, 2 hectares of mangroves were restored in the Palisadoes Port Royal Protected Area and Ramsar Site, and 949 fruit trees were distributed to schools and communities. Alternative livelihoods were introduced to local communities through the distribution of 250 bee colonies (31 additional under this reporting period) along with equipment and trainings for their use.

At the urban landscape level, Xalapa installed 12, Kingston 6 and San Salvador 11 rainwater harvesting systems in public buildings and schools under previous reporting periods. In Xalapa, 5 infiltration gardens were installed: the soil infiltration capacity was measured as 200 mm of rain /m<sup>2</sup> /every 6h under previous reporting periods, reducing flooding in front of a hospital and a school and improving the conditions of more than 5,000 people per month waiting outside the hospital with adequate space and 6 miyawaki forests that invite reconnection with nature.

All three cities collaborated with schools and community centers to develop urban gardens: San Salvador installed 11, Xalapa 10 and Kingston 3, with 2 additional container gardens and 1 hydroponic infrastructure built under this reporting period in Jamaica. One agricultural start-up kit was distributed with each urban garden in Xalapa and in San Salvador. To support the piloting of the EbA measures, implementation protocols characterizing the interventions were developed in all three cities and in this reporting period compiled into a booklet of 20 protocols in Spanish and 10 in English. In addition, a compendium of 19 other NbS interventions that were not implemented by the project but could enhance urban resilience, was formulated, designed and launched.

Enhanced communication on the project results under **Component 3** has been one of the cornerstones of the project strategy since early 2020, with a focus on disseminating key messages on urban EbA measures not only to decision-makers or the three specific countries, but also to a wider regional audience. The monthly webinars initiative “*Wednesdays of CityAdapt*” continued under this reporting period, with 6 new webinars on urban NbS, and a special edition for the launching of a UNEP publication on urban NbS for LAC cities, that drew lessons learnt from the project. Under the previous reporting period, the project web platform had been merged with the Nature4Cities LAC initiative, one of CityAdapt’s regional upscaling projects that started its implementation in 2021. This merge has proved successful, with an increase in online material uploaded and visibility of its content worldwide, ensuring a wider impact of the knowledge component of both projects and a sustainability to CityAdapt’s products. The web platform obtained close to 49,000 new views under this reporting period, and the Youtube account gained 395 new subscribers. Additional content was developed and shared through social and digital networks, including several videos, guidelines and publications, with a clear increase in Jamaican content. Research partnerships were finalized with a total of 24 reports produced on urban NbS across the three cities (11 additional under this reporting period), demonstrating how long-term research strategies can generate scientific knowledge and evidence on the potential benefits of EbA in urban areas.

**Rating towards outputs:** The rating towards outputs remains satisfactory: challenges reported in the previous PIR were addressed, and while differences in execution rates resulted in an earlier conclusion of the project in Mexico and El Salvador, Jamaica successfully finished its implementation in this reporting period, reaching most of its targets and even exceeding some of them.

As previously reported, an adaptive management approach was adopted to make most of the limited resources and to maximize the relevance and efficient delivery of the project interventions. The delivery of some outputs has been combined under a single process, and the timelines and budgets were adjusted. This has included some changes from the original workplan, especially concerning certain planned interventions in Kingston that were no longer relevant or appropriate. As a result, some project targets and delivery dates were revised in the previous PIR.

One last technical advisory committee meeting took place under this reporting period in Kingston, to showcase the final results in December 2023. These committees had been put in place throughout project implementation, bringing together relevant institutions and stakeholders to ensure appropriate guidance and integration with ongoing initiatives and strategies, thus enforcing the created synergies between different sectors of the municipalities. They ensured the transfer of results from the project, local ownership and the use of these results for real transformation of city planning processes.

**Overall risk rating:** The risk rating for the project remains “medium”.

In terms of the challenges posed by high staff turnover in implementing partner agencies, despite the change in municipal and national governments in all three countries under this reporting period, all the interventions were concluded. In Xalapa, the previously reported changes in the municipal office did result in a limited ownership, including the freeze of the 2% water mechanism developed in 2021; nonetheless, the Committee for Environmental Services is still in place and the municipal team demonstrated ownership of some EbA interventions, notably the restoration of the natural wetland Molino de San Roque. The national elections in June 2024 maintain the political colors at the national level, and the expected changes are being anticipated with the UNEP national office in Mexico. A similar situation was noted in El Salvador, where the presidential party was reelected in February 2024, and in Jamaica, that had local elections in February 2024 too. Challenges with the ownership of the project in Jamaica by the national counterpart and the municipality in Kingston have not been fully resolved by the end of the project, due to high turnover of staff within the Climate Change Division (CCD) of the MEGJC and the lack of participation of municipal staff, that limited the capacity building and engagement in the project’s scope. Exchanges with the Planning Institute of Jamaica (PIOJ) did indicate higher interest in project results, and their role in the development of the National Adaptation Plan (NAP) places them as a key actor in climate change adaptation in the country.

On the other hand, while the overall project progress is good, there were significant differences in the capacity and engagement between the three countries, resulting in different levels of target achievement and quality of deliverables. Implementation was completed with a delay of 6 months in Jamaica compared to El Salvador and Mexico, and these two countries also achieved greater results in terms of impacts and sustainability, maintaining a higher level of ownership and delivery. The project in Jamaica also suffered greater impacts from administrative issues that caused significant delays in processing payments to the implementing partners and consultants under this reporting period – due to the combination of several financial challenges within the UNEP system. This had a direct implication on the closing of the project and its perception by local partners and beneficiaries.

Additionally, under this reporting period, extreme events posed a serious risk to the EbA interventions in all three countries. Less significantly, the droughts from El Niño resulted in delayed reforestation activities and increased mortality of plants, as well as additional maintenance needs; this was however mitigated with the support of the implementing partners (mainly PROCOMES in El Salvador and the Forestry Department in Jamaica). Nonetheless, the passage of hurricane Beryl in Jamaica in June-July 2024, the earliest Hurricane 5 of the season ever monitored in the Caribbean, poses a serious threat to the EbA measures that were implemented in Kingston. To this date, informal reports indicate a high level of damage to the beehives and the urban gardens and green infrastructure, while no monitoring has yet been conducted formally. The necessity to attend to the most-pressing impact of such an intense extreme event also results in less attention provided to the NbS interventions of the project, and the closure of CityAdapt means that all follow-up measures will solely depend on local actors and institutions, and on their capacity to provide monitoring and maintenance to the measures. Nonetheless, as all interventions had been concluded with the key beneficiaries, there is a good probability to recover the ones targeting restoration of natural areas with the Forestry Department and the ones providing additional livelihoods (mainly beehives) with the support of Jamaica 4H Clubs.

#### 2.4. Co-financing

|  |   |
|--|---|
| <b>Planned Co-finance Total:</b><br>USD 29,734,000 | No additional co-financing is reported under this period. |
|--|---|

|   |  |
|---|--|
| <p><b>Actual to date:</b><br/>USD 30,545,073<br/>(103%), as of 30 June 2024</p> | <p>The co-financing presented by the government of <b>El Salvador</b> for this project is: i) the detention basin for USD 21,920,000; and ii) Master drainage plan for USD 651,537, for a total co-financing of USD 22,571,537. Both projects have finished, the first in 2020 and the second in 2019, and their impacts are being measured. CityAdapt’s EbA interventions complement the detention basin by constructing infiltration ditches on the slope of the San Salvador volcano: the EbA measures increase water infiltration on the upper levels of the city and reduce the water runoff that arrives to the detention basin. A comparative analysis of these two infrastructures was done in 2020 and is available <a href="#">here</a>. Additional green infrastructure implemented by CityAdapt, such as absorption wells and climate-resilient restoration interventions at the watershed scale contribute to the same objective as the detention pond and the drainage plan, which is to reduce the risk of flooding and landslides in the urban areas.</p> <p>Moreover, additional leveraged funding was identified in San Salvador through the financing of a water harvesting system by a cooperative, installed to complement the community garden built by the project, for a total of USD 4,336 (including co-financing). For the installation of the water harvesting system in San Isidro community, the support received from the community stands out through the mutual aid system, which collaborated with land clearing and unskilled labour for the construction of the storage tank. The established amount was USD 4,766. In the restoration of coffee plantations, coffee farmers received 118,500 coffee trees from the Ministry of Agriculture under a support program for the coffee sector in 2019. These trees, along with the trees provided by the project, were planted by the cooperatives at their own expense and with their own staff, adding to the commitment and ownership of these beneficiaries. According to the cost-benefit analysis for the planting of fruit trees, this corresponds to USD 2.83/plant (the amount includes land clearing, plant transfer, hollowing out, hauling and planting), making a total of USD 335,335 in co-financing.</p> <p>In the case of the city of Xalapa, <b>Mexico</b>, co-financing from Fernando Gutierrez Barrios stormwater collector, for USD 2,105,263, was finalized in 2017. This grey infrastructure is complemented by two CityAdapt interventions, which are the riparian restoration of the Papas River and the ecological restoration of the Estropajo Hill. Because these two measures are implemented in the same area and will also contribute to the increased water infiltration and decreased sedimentation, they should directly contribute to the objective of the water collector. More information on the monitoring plan for these measures can be found in section 3.2. The communication material and awareness raised on this topic in the neighborhood should also contribute to expanding the benefits and lifespan of the water collector.</p> <p>Three other sources of co-financing were identified in Xalapa during implementation: (1) Rainwater harvesting systems at public buildings from Xalapa city council for USD 92,760; (2) Rainwater harvesting systems at domestic level from the Gonzalo Río Arronte Foundation for a total of USD 100,000, and (3) the resources collected from the voluntary contribution of 2% in the water bills in the city, for a total USD 494,027 collected to date. Some of the resources from the voluntary contribution will serve to scale the interventions in the Papas River and in the Estropajo Hill, which contributes to reducing the amount of sediment that reaches the Gutierrez Barrios collector and represents savings in maintenance costs (for more information on M&amp;E, see section 3.2). CityAdapt is collaborating with the city’s sanitation operator to monitor these interventions: they are providing the collector’s maintenance program to evaluate the economic benefits and to estimate the economic impact of the decrease in sediments in the long term. Finally, within the framework of the upscaling strategy, which aims at working with seven cities in Mexico, the Gonzalo Río Arronte Foundation has provided USD 200,000 for undertaking climate change vulnerability assessments in three of the CityAdapt 2.0 Initiative cities; in addition USD 20,000 were mobilized from GGGI and FMCN for initiating consultations within the cities.</p> |
|---|--|

|                 |  |
|-----------------|--|
|                 | <p>In <b>Jamaica</b>, co-financing of USD 4,000,000 was linked to the World Bank <i>Integrated Community Development</i> Project (ICDP), implemented by the Jamaica Social Investment Fund, which ended in May 2021. The ICDP aimed to promote public safety and transformation through the delivery of basic infrastructure and social services in 18 communities across Jamaica, two of which are a part of the CityAdapt Kingston Project site, namely Tivoli Gardens and Greenwich Town. Activities implemented by this project, such as greening of communities, alternative livelihood training for youth as well as improvement in solid waste management and infrastructure, benefitted the projected outcomes of CityAdapt, as the activities were implemented with the same potential target beneficiaries as CityAdapt interventions. The sensitization and public awareness component of the ICDP provided a foundation for the CityAdapt project to engage stakeholders in the project site.</p> <p>Project implementation partner, the Forestry Department, also provided in-kind support for the project, valued at USD 17,056. The co-financing comprised technical and administrative support, the facilitation and attendance of public meetings and trainings by staff, as well as the use of office/laboratory space for project activities, specifically the verification of the seedlings selected for use in the silviculture plan. The other implementing partner, TNC, also provided co-financing to two of the activities implemented under their agreement: (i) after the success of the EbA training, a second cohort was organized and financed by TNC for USD 3,750; and (ii) to ensure a stronger result of the upscaling strategy activity, TNC added USD 4,500 of its budget.</p> <p>At the <b>regional</b> level, co-financing of USD 250,000 from the REGATTA programme (Regional getaway for technology transfer and climate change) was reached in 2020, focused on promoting knowledge sharing of climate change technologies and experiences for climate resilient development in Latin America and the Caribbean. Contribution from UNEP senior management staff time for a total of USD 228,000 was also achieved in early reporting periods. Additional financing was leveraged from the EU Programme Euroclima+ and Norway bilateral funds (NFL) in 2020 through the Contribution to the online course Financing and Climate Action in Cities: Nature-based Solutions as a mechanism for adaptation in Latin America and the Caribbean in 2020 for a total of USD 48,000. In 2022, both initiatives also contributed to the elaboration of a publication on NbS in the LAC region for a total of USD 43,327. Both knowledge management initiatives directly contributed to the objective of this project and to the activities under outcome 1 and 3 of the CityAdapt; they include key messages and lessons learnt from the project implementation, ensuring a wider impact at the regional level.</p> <p>Additional co-financing was identified in 2023 through the Climate Change Adaptation Unit for three activities. The first one was the launch of the new CityAdapt web platform and the adding of the new features and tools for urban NbS – this represented USD 15,000 from bilateral funding from Japan government. The second one consisted of the development of three case studies on lessons learnt on CityAdapt, focusing: (i) Financing Ecosystem-based Adaptation in Cities (México); (ii) Gender-responsive Ecosystem-based Adaptation (El Salvador); and (iii) A Watershed Approach in Ecosystem-based Adaptation (Regional scope). The total co-financing for these case studies was of USD 7,200 from SIDA bilateral funding. Finally, a video and UNEP news article was also launched under this reporting period on Xalapa’s Rainwater Harvesting Systems and Ecosystem restoration approach, that was produced for USD 15,000.</p> |
| <b>Progress</b> | Original co-finance had already been accounted for under previous reporting periods. Under this reporting period, no additional co-finance was identified.   |

**2.5. Stakeholder engagement**

|   |  |
|---|--|
| <b>Date of project steering committee meeting</b> | <p><u>Xalapa</u>: 7 Technical committee meetings were held, all reports are available <a href="#">here</a>:</p> <ul style="list-style-type: none"> <li>• March 28<sup>th</sup>, 2018</li> <li>• April 19<sup>th</sup>, 2019</li> <li>• January 20<sup>th</sup>, 2020</li> <li>• August 18<sup>th</sup>, 2020</li> <li>• March 16<sup>th</sup>, 2021</li> <li>• December 14<sup>th</sup>, 2021</li> <li>• July 14<sup>th</sup>, 2022</li> <li>• July 27<sup>th</sup>, 2023</li> </ul> <p><u>Kingston</u>: 3 Technical Committee meetings were held, all reports are available <a href="#">here</a>:</p> <ul style="list-style-type: none"> <li>• February 22<sup>nd</sup>, 2018</li> <li>• December 2<sup>nd</sup>, 2022</li> <li>• July 13<sup>th</sup>, 2023</li> <li>• November 29<sup>th</sup>, 2023</li> </ul> <p><u>San Salvador</u>: 6 Technical Committee meetings were held, all reports are available <a href="#">here</a>:</p> <ul style="list-style-type: none"> <li>• June 14<sup>th</sup>, 2018</li> <li>• March 14<sup>th</sup>, 2019</li> <li>• August 12<sup>th</sup>, 2021</li> <li>• June 9<sup>th</sup>, 2022</li> <li>• November 21<sup>st</sup>, 2022</li> <li>• June 13<sup>th</sup>, 2023</li> </ul>  |
| <b>Stakeholder engagement</b>                     | <p>The project was implemented with the support of national organizations (CSOs) as a means to ensure sustainability of results and ownership of the process. The situation was different depending on the country and the existing capacities – one NGO supported the implementation in Mexico, two in El Salvador and three in Jamaica. Moreover, the project reached a wide variety of actors – from decision-makers to civil society, as well as academia, private sector and more. Engagement is targeted to each group to ensure greater impact of activities.</p> <p>Lessons learnt from implementation enabled the detailing of the actor mapping exercise and the adapting of the stakeholder engagement strategy to the different activities and goals. The complex and integrated approach of the project, as well as the large number of actors involved in urban development, was a challenge for stakeholders' involvement in the project, requiring a constant follow-up with existing partners and engagement of new ones based on the activities' needs and the political context.</p> <p>National stakeholders were engaged in Jamaica to enhance awareness and understanding of project activities and key concepts, especially PIOJ and the Ministry of Public Works, to consolidate sustainability of project interventions. This includes national government, NGOs and CSOs, as was also suggested under recommendations 8.3.3, 8.4 and 8.5 of the project's MTR. In Mexico and El Salvador, as implementation concluded, an emphasis was given to reinforcing engagement with communities and beneficiaries involved in the project. This was noticed during the <a href="#">special Wednesday of CityAdapt webinar</a>, where representatives from local communities, public bodies and counterparts were invited to share lessons learned and discuss upscaling potential and sustainability of project interventions.</p> <p>Capacity building exercises continued with local organizations in Jamaica, focused mainly on the maintenance of the EbA interventions, as well as the integration of climate change in urban planning and scaling up strategies for EbA measures in all countries. The collaboration with the University of Wageningen (WENR) ended under previous reporting periods (September 2021), but their support in strengthening the technical capacities of the stakeholders involved was key.</p> |

|  |   |
|--|---|
|  | <p>In Mexico, as part of the up-scaling and dissemination strategy for the Ecosystem-based Adaptation approach, 152 local government officials (65 women) were trained in previous reporting period through courses and workshops on decision-making tools, climate-resilient communities, cost-benefit analysis, and public policies for recruitment. In addition, more than 900 people (434 women) were informed about the experience and lessons learned from CityAdapt (academics, local governments of other cities, decision-makers, and citizens) through forums such as one on urban forests organized by FAO and a regional meeting on vulnerability to climate change organized by SEMARNAT and INECC, among others.</p> <p>In Jamaica, an Urban EbA training component was developed under previous reporting period, with over 85 government and private sector stakeholders trained in Urban EbA. The feedback and results from this cohort was such that a second cohort was organized and financed by TNC. Under this reporting period, the training was institutionalized with other organization in Jamaica, ensuring the manual training could be further used and mainstreamed in other curricula.</p> <p>In El Salvador, the community garden located in La Reforma Community obtained general engagement with the different beneficiaries. Several “champions”, representative of specific interventions, were invited to participate in global events and podcasts, demonstrating their comprehension of the concept and their new role as ambassadors of urban NbS.</p> <p>In terms of partnerships with local CSOs, in <b>Mexico</b>, one NGO led the execution of project activities: Fondo Golfo de Mexico (FGM), an organization with years of experience on environmental and climate change projects in the region. It is linked to a larger national organization, Fondo Mexicano para la Conservación de la Naturaleza (FMCN), that has been engaged since 2021 to develop a CityAdapt 2.0 project for GCF funding, involving seven mid-sized cities in Mexico to improve resilience to climate change and reduce water stress and vulnerability to extreme hydrometeorological events through NbS, integrating green and grey infrastructure, and strengthening technical, institutional, participatory, and financial capacities.</p> <p>Within this upscaling strategy to other cities in Mexico, CityAdapt participated in previous reporting period with World Resources Institute (WRI) in the project called "NbS Accelerator" funded by the UK Pact, training more than 80 officials from 16 sub-national governments to accelerate the adoption of Nature-based Solutions in urban planning. The training, built on CityAdapt's experience, addressed aspects such as vulnerability to climate change, Nature-based Solutions for cities, Monitoring and Evaluation, and the design of a national and international financing roadmap.</p> <p>Partnerships with the universities and research centers involved in the project, namely Universidad Veracruzana, Tecnológico de Xalapa and Instituto de Ecología, AC, were strengthened with the MSc research projects. Regarding rainwater harvesting systems, many actors were involved in the scaling up of these measures: mainly the civil association Sendas, AC, and two actors that provided co-financing to replicate the measure and ensure long-term monitoring: the city council of Xalapa and the Gonzalo Río Arronte Foundation. During the implementation process, CityAdapt has convened different actors, among which local government officials, organized civil society, academia, private sector, and interested citizens. Consultations, awareness-raising workshops, interviews and surveys were undertaken to understand the population's perception of the actions, achieving good social acceptance and involvement of key actors, including the vulnerable communities.</p> <p>As part of the strategy for involvement of key stakeholders and adoption of the EbA and NbS approaches to climate change, CityAdapt participated in two governance and decision-making mechanisms at the local and subnational level, with the ability to express opinions and the right to vote. It was part of the Environmental Services Council whose purpose is to recommend, advise and promote the conservation of the Pixquiac watershed and the integrated management of water resources from a perspective of the conservation of ecosystems and the services they provide to the city. It also participated in the state council for mitigation and adaptation to the effects of climate change, which brings together the entire</p> |
|--|---|

|  |  |
|--|--|
|  | <p>structure of the state government and aims at the coordination of all agencies to channel efforts and actions to face the negative effects of climate change in the state of Veracruz. Through these councils CityAdapt disseminated actions, made public policy recommendations and shared tools for decision-making based on experience. It also organized tours with counsellors to experience the project interventions carried out at the level of the urban landscape and local communities with the objective to raise awareness and demonstrate the multiple benefits that this type of solution can bring to a city like Xalapa.</p> <p>In <b>Jamaica</b>, three partners were engaged, which increased the rate of project implementation over the last two reporting periods. The Forestry Department which is the agency responsible for the management of forest resources in Jamaica and has decades of experience in reforestation, agroforestry and wetland rehabilitation, has been conducting all related activities. They have been engaging local stakeholders to assist with the implementation of activities and have also been working closely with the University of the West Indies, Mona Campus to rehabilitate wetlands in the Port Royal community in Kingston. The Forestry Department will also be conducting maintenance of interventions with the project end, given the mandate of the entity. The Nature Conservancy (TNC) led the policy-related activities, the training, as well as the development of the vulnerability assessment and upscaling strategy. TNC has valuable experience in these particular areas, having conducted projects with similar expected outcomes in Jamaica. The third collaboration is with Jamaica 4-H Clubs, which promotes agriculture training among young population as a means to maintain the link between citizens and the rural environment. It is crucially important to build the capacity of these organizations on climate change adaptation, so this approach can be incorporated into their activities and disseminated at the national level. Partnership with these organizations also provides an opportunity to disseminate results from the project at a much wider level.</p> <p>Capacity building was enhanced through a training programme developed by TNC and provided to a range of actors, including the municipal corporation, and alternative livelihood trainings are being provided at the community level by 4-H Clubs. Community members were trained in beekeeping based on the bee colonies distributed to support livelihood start-up. Community members, school students and staff were also engaged in rainwater harvesting and urban gardening training for maintenance. The project also worked with the Abilities Foundation, an organization for teenage students (age ranging from 14 to 17) of different types of physical and mental disabilities, which directly participate in the school's agricultural programme, and thus benefit from the activities related to the urban gardens that are irrigated with the water collected from this intervention.</p> <p>In <b>El Salvador</b>, the project engaged two national organizations. FUNDASAL has expertise in rural and urban housing, neighbourhood improvement, and risk mitigation in urban and rural neighbourhoods. The institutional methodological basis of FUNDASAL is community-focused learning-by-doing and mutual aid. They also have presence in various departments of El Salvador. Thanks to lessons learnt from this project and with the support of the UNEP national team, FUNDASAL developed a new environmental and climate justice policy, to include climate change considerations in its long-term strategy and management. PROCOMES, on the other hand, has experience in urban communities in the metropolitan area of San Salvador. They have previously developed projects with the participation of civil society on topics such as risk reduction, food and nutrition security, basic sanitation and environment. One of their main lines of work is to improve the productive value chains, specifically coffee and urban agriculture. Thanks to learnings from this project, PROCOMES started a regional program with a Honduran academic institution to promote scholarships in agricultural sciences with special emphasis on preparation for climate change adaptation, taking into account the implemented NbS interventions and their impact measurement process.</p> <p>The collaboration with the metropolitan area of San Salvador's Planning Office (OPAMSS) was a key highlight of the project. While CityAdapt focused its interventions in the Arenal Monserrat micro-watershed, made up of 3 municipalities (Santa Tecla, Antiguo Cuscatlán and San Salvador), upscaling and replication opportunities were identified with the OPAMSS. This technical entity supports the municipalities of the San Salvador Metropolitan Area (AMSS) in urban planning and is a key partner to mainstream EbA into territorial planning. In</p> |
|--|--|

|  |  |
|--|--|
|  | <p>that regard, after a large landslide occurred in an AMSS municipality in 2020, the municipality of Nejapa was engaged and invited to participate in the training sessions. Entry points to the project were identified under previous reporting period, with several capacity building sessions organized with the technical staff of the municipality of Nejapa. As a result of these trainings, four plans were elaborated that integrate NbS into urban planning.</p> <p>Progress was also achieved with the research projects with the National and the Central American (UCA) universities, to show the benefits of EbA. Under this line of work, CityAdapt developed a collaboration between the Faculty of Agronomic Sciences of the National University and a private company – Sigma Q, that financed a research programme through equipment and sponsorship. Using the i-Tree platform, the study proposes a method for the restoration of the Bicentenario Park, a 90-hectares protected natural area within the micro-watershed of Arenal Monserrat where CityAdapt interventions were implemented. Based on this positive experience with the private sector, a new strategy was initiated under the last reporting periods to engage a wider variety of private actors, targeting mainly the construction sector, as well as food and plastic production, to integrate adaptation to climate change in their portfolio. In addition, other research were carried out with the National University on the impact of NbS on coffee forests in the micro-watershed and on the measurement of water quality of the water harvesting and biogardening systems, 5 of which were finalized under this reporting period.</p> <p>On the other hand, EbA interventions require the participation of the beneficiary communities. Students, teachers and parents are directly responsible for the installation and maintenance of school gardens. At the community level, the communities selected the variety of vegetables and fruit trees to be planted in the urban gardens and in the restored areas, and participated voluntarily in planting them. The involvement of coffee cooperatives in the training sessions and the implementation of sustainable agriculture practices and EbA measures has also been crucial in this project.</p> <p>Finally, at the <b>regional</b> level, stakeholders from the entire region were continuously engaged in the project through the webinar initiative “<i>Wednesdays of CityAdapt</i>” and trimestral newsletters. The webinars are viewed by a large variety of actors and stakeholders, including public officials, technicians from NGOs and international organizations, researchers, students, etc. The web platform joined efforts with the Nature4Cities LAC Readiness project, also implemented by UNEP, to increase visibility and support the dissemination of urban NbS material. Under this reporting period, new features were added to the platform (engagement with the private sector and open calls for financing, for instance), and new tools will be added in the coming months (a MOOC to be launched in Q3 2024). This ensures long-term sustainability of the knowledge material and outreach to a wide scale of audiences.</p> <p>The project collaborated with the EU-funded Euroclima+ program to disseminate its content and strengthen its network. This partnership was also key in the development of the course “<i>Climate action and financing in cities: Nature-based solutions as a mechanism for adaptation in Latin America and the Caribbean</i>” in 2020, and the elaboration of a UNEP publication “<i>Nature-based Solutions for climate change resilient cities - perspectives and experiences from Latin America</i>”. Both initiatives benefited from the support of the NGO Practical Action and provided key alliances with tutors and students. Through these initiatives, the CityAdapt website became a reference platform for the region on Nature-based Solutions for adaptation in urban areas, being quoted in a variety of publications and urban planning instruments, including the latest <a href="#">guideline for the implementation of Nature-based Solutions in Quito, Ecuador</a>.</p> |
|--|--|

**2.6. Gender**

|  |    |
|--|----|
| <b>Does the project have a gender action plan?</b> | No |
|--|----|

|                             |  |
|-----------------------------|--|
| <b>Gender mainstreaming</b> | <p>At the initial stage of the project, a partnership was established between UNEP and UN Women to incorporate gender mainstreaming throughout the project implementation cycle, including the development and implementation of a Gender Action Plan and gendered results frameworks in El Salvador and Mexico. The approach implied incorporating and validating gender-based elements to the existing project work plan and its correspondingly allocated funds, going beyond the gender-disaggregated indicators included in the validated Project Document. Following this partnership, the case studies from San Salvador and Xalapa were included in the 2020 UN Women-UNDP-UNEP publication “<i>From words to action</i>” (see full publication <a href="#">here</a> and the project’s case study <a href="#">here</a>). Under this reporting period, a story on CityAdapt’s gender focus was published on UNEP LAC climate change platform (see <a href="#">here</a>).</p> <p>In Xalapa, 70% of the residents involved in the comprehensive intervention in the Molino de San Roque natural protected area were women. This intervention included the construction of 1,000m of infiltration trails and actions to support the recovery of the natural wetland, such as removing invasive species and recovering the water level and revegetation with species natives (See video <a href="#">here</a>). Also, within the framework of the exit strategy and during the maintenance stage of the most significant interventions, women were involved in training processes to strengthen resilient livelihoods, such as in Cerro del Estropajo (see report <a href="#">here</a>). Finally, through the Environmental Services Council, workshops were held for 30 operating personnel (14 of them women) of the Xalapa drinking water and sanitation commission, on the design and installation of rainwater harvesting systems and on the importance of adopting coexistence schemes with nature and conservation of ecosystems that provide, in addition to water, their income source.</p> <p>The vulnerability assessment developed under previous reporting period also considered a set of gender-sensitive indicators, thus resulting in the identification of the most gender sensitive vulnerability zones in the city. In Xalapa, these areas are precisely where the project interventions were implemented: one of them, the edible mushroom livelihood diversification activities was implemented with a new gender-sensitive approach in 2019 and 2020, training the beneficiaries in gender equity, women’s empowerment, and access to local markets (see manual <a href="#">here</a>). Under the previous reporting period, the riparian restoration project of an urban stream also promoted the participation of female heads of households and neighbourhood community. They were trained to lead the reforestation teams and created the <i>River guardians</i> identity, an initiative that brings together people interested in collaborating in training and reforestation (70% are women), who were trained in the different stages of the activity and are responsible for the maintenance and monitoring of the actions. This initiative was supported by the head of the community management center, the Municipal Institute of Women of Xalapa, and the Deputy Director of Youth of the city council, achieving the engagement of 10 groups of women. In late 2021, the ecological restoration of the Estropajo hill and the agrosilvopastoral interventions also maintained a gender perspective in their training components. Out of the 27 women trained (48%), two got a fixed contract with one of the CSOs working in the project, thus providing an alternative and sustainable livelihood related to reforestation and community involvement.</p> <p>In Jamaica, the beekeeping initiative has targeted 60% involvement of women. The Nature Conservancy trained 85 persons in urban EbA, 62% of which are women. The vulnerability assessment also includes a socioeconomic assessment with gender-focused data collection. Gender considerations were also included throughout project implementation, adapting training programmes to fit women’s daily tasks, supporting them with day care responsibilities and providing additional transport to ensure their participation in the different project activities.</p> <p>Gender indicators were also incorporated in several of the project’s activities. In San Salvador, methodological gaps were revealed during the production of the vulnerability assessment, which led to the elaboration of a new protocol for the collection of socioeconomic and environmental data with gender-sensitive indicators, tested in an urban community, Colonia IVU (see <a href="#">here</a>). Gender-focused activities have also taken place</p> |
|-----------------------------|--|

|  |  |
|--|--|
|  | <p>during the implementation of the restoration of coffee plantations, the elaboration of infiltration ditches and agroecological practices in the El Espino coffee growers' cooperative. Indeed, the women's group <i>Ahorradoras</i> ("savers", responsible for the finances of the cooperative), took new initiatives based on the training sessions on climate change and EbA measures proposed by CityAdapt. The group requested the installation of a community garden that would serve not only to supply the community but also as a source of income from these additional livelihoods. Together with the project team, the garden was built with a drip irrigation system, to make more efficient use of water, and the cooperative installed a rainwater collecting system on the roof. Inaugurated in April 2021, the community garden is 500 square meters in size, with 16 varieties of vegetables and aromatic herbs and is maintained by 22 people, of which 78% are women and the rest are youth from the community (see video <a href="#">here</a>). In the previous reporting period, this group of women and young people participated in training on how to sow, harvest and make cocoa products, since the project also supported them in a plot to plant cocoa plants and thus improve their agricultural diversity. Under this reporting period, the cooperative was selected by the Global Commission of Adaptation for the Local Adaptation Champions Awards in the <b>Women in Leadership category</b> (see <a href="#">here</a> the GCA article and the video made for the final selection <a href="#">here</a>), and a case study on <i>Gender-responsive Ecosystem-based Adaptation</i> was published in UNEP's website.</p> |
|--|--|

### 2.7. Environmental and social safeguards management

|   |  |
|---|--|
| <b>Moderate/High risk projects (in terms of Environmental and social safeguards)</b>                    | <p>Was the project classified as <b>moderate/high risk CEO Endorsement/Approval Stage</b>?<br/>No</p> <p>If yes, what specific <b>safeguard risks</b> were identified in the SRIF/ESERN?<br/>N/A.</p>  |
| New social and/or environmental risks   | No   |
| Complaints and grievances related to social and/or environmental impacts (to be filled in by TM and EA) | <p>Has the project received complaints related to social and/or environmental impacts (actual or potential) during the reporting period?<br/>No</p>  |
| Environmental and social safeguards management  | <p>In the Environmental and Social Safeguards Screening undertaken during the project preparation phase in 2016, no specific safeguard areas of concern were identified. UNEP's standards are applied in this project and almost all local partner supporting local implementation also have their own policy of E&amp;S safeguards (FGM's can be found <a href="#">here</a>, PROCOMES' <a href="#">here</a>, FUNDASAL's <a href="#">here</a> and TNC's <a href="#">here</a>). These standards match a majority of GEF's requirements, with the exception of Indigenous peoples, Conflict resolution and Displacement and resettlement, that are not relevant in this project's context.</p> <p>Concerning <b>Environmental and Social Assessment, Management and Monitoring (MS1)</b>, the project's interventions were designed to ensure that no environmental or social negative impacts would result from its activities. The EbA measures are site-specific, with minimum risk associated and do not involve major impacts to surrounding environment or stakeholders. The finalization of vulnerability assessments in Kingston, San Salvador and Xalapa, ensured that the EbA interventions were selected according to identified climate risks and with social approval. These evaluations were conducted through a participative process, involving both decision makers and representatives from civil society and local communities. Terms of references for partners also included considerations of safeguards</p> |

|  |   |
|--|---|
|  | <p>risks, and guidelines for EbA interventions, to prevent or reduce negative environmental or social impacts, and to ensure that reforestation activities in particular involved local stakeholders in the selection of indigenous species to avoid any invasive plantation or detrimental activity.</p> <p>The project aimed at ensuring the sustainable management of ecosystems to strengthen the cities’ resilience to climate change, thus working towards <b>Biodiversity Conservation and the Sustainable Management of Living Natural Resources (MS3)</b>. The project included activities to restore degraded ecosystems in all three cities and to reduce climate change vulnerability. The project contributed to reducing flooding within the cities through water storage, infiltration and harvesting techniques through Nature-based Solutions. Reforestation in Jamaica and El Salvador also contributed to the reduction of soil erosion and water run-off from peri-urban watersheds. In San Salvador, restoration activities were implemented in a buffer zone around a protected area. This was done with native species and with approaches to ensure there were no negative impacts on the protected area. An inventory of native species present in the area was carried out, as well as seed collection and the installation of a nursery with the collected seeds, from which plants were sown in the area.</p> <p>In Xalapa, regarding the participation in the ecosystem services board, the local authorities advised by the members of the council managed to register more than 1,564 hectares to a tripartite agreement made up of the national forestry commission, the state government and the Xalapa city council that allocated resources for paying compensation for environmental services (see agreement <a href="#">here</a>). Additional areas were identified for conservation purposes that would be financed by local authorities. Other actions in Xalapa were implemented at different scales, in watersheds, urban landscapes, and local communities. Actions included ecological restoration of riparian zones, soil conservation strategies, best practices in agroforestry, and silvopastoral management. These activities were focused on the conservation of ecosystems and environmental services of the watershed that provides water for the city (Pixquiác river), in addition to promoting connectivity between two natural protected areas (Cerro de la galaxia and the archipelago of forests and jungles of the capital region of Xalapa). In Jamaica, the rehabilitated wetland required environmental permits and this was processed with national authorities.</p> <p>Reforestation activities also contributed to the improvement in the cities’ air quality, thus contributing to pollution reduction, while the project presented no additional risk of pollution. Given the lack of air quality monitoring stations in El Salvador, the project developed an air quality measurement methodology by visualizing lichens on trees. This measurement, also known as Lichen Biodiversity, is a key indicator of air quality and its monitoring provided regular information of pollution (see protocol <a href="#">here</a>). The activity was carried out in one of the areas that was reforested with fruit trees and riparian vegetation. More information on this monitoring scheme is provided in section 3.2. The activities at the watershed level strengthen water filtration and, coupled with the rainwater harvesting systems, contributed to improvement in water quality. Additionally, the urban school gardens and coffee planting restoration activities were developed with agroecological methods, using organic pesticides and fertilizers to avoid further use of chemical products. The coffee farms’ training also included organic plague management, thus tackling soil <b>pollution prevention (MS7)</b>.</p> <p>The trainings with coffee farmers in El Salvador have somewhat interfered with traditional production practices, as was described in the 2019 PIR. Indeed, by promoting agroecological measures and the use of infiltration ditches, the project provided alternatives to the “<i>encajuelado</i>” and “<i>ahoyado</i>” tradition<sup>2</sup>. Nevertheless, during the previous reporting periods, the beneficial aspects of EbA measures have been demonstrated, understood and integrated. Contrary to what was expected in the project</p> |
|--|---|

<sup>2</sup> The “*encajuelado*” or “*ahoyado*” is a coffee plantation practice, that consists of making holes of 30x30x30 cm next to the coffee plant, whose only benefit is to maintain the humidity of the plant. By showing alternatives of infiltration ditches of 30x40x50 cm, other benefits were demonstrated to the farmers, such as soil moisture retention, nutrient retention, erosion regulation, and soil formation.

|--|--|
|  | <p>design, <b>Cultural Heritage (MS6)</b>, in the form of traditional activities, was thus somewhat affected by this project. In Xalapa, this was observed during the edible mushroom activities, that assisted women that depended on certain traditional corn production (<i>maiz criollo</i>) to gain an alternative income, which supports the maintenance of their ancestral practices, called <i>Nixtamalización</i>.</p> <p>Capacity trainings on women’s empowerment and accessibility of local markets for trained local producers also contributed to positive <b>Labor and Working Conditions (MS8)</b>. The project provided trainings and professional opportunities to support or improve social and economic activities, with the alternative climate-resilient livelihood activities promoting new ways to add value to farmers’ products, thus gaining appreciable income and strengthening the communities’ climate resilience.</p> <p>Finally, <b>Community Health, Safety and Security (MS9)</b> was addressed through the scope of water and food security. The installation of rainwater harvesting systems in schools and public buildings in all three countries improved water availability and storage capacity. The organic food produced by urban gardens in Kingston and San Salvador has also been served in school canteens and contributed to students’ healthy and safe diet.</p> |

## 2.8. Knowledge management

|  |  |
|--|--|
| <b>Knowledge activities and products</b> | <p>Within the exit strategy of the project, the project’s communication and knowledge-sharing activities were consolidated. Results from project activities have been compiled in a series of new materials, and the project’s website has continued to be used as a key tool disseminate the project’s lessons learnt and key results. Please visit <a href="http://www.CityAdapt.com">www.CityAdapt.com</a> for more information.</p> <p>A new version of the web platform was launched in December 2022, based on the joint efforts with the Nature4Cities project. The platform is composed of a series of tools for the implementation of NbS measures and includes new features added in this reporting period, such as the <a href="#">private sector page</a> and the <a href="#">community of practice</a>. Other existing tools, such as the <a href="#">publications</a>, <a href="#">news</a>, or the <a href="#">visualization</a> one geo-localizing the pilot NbS measures in the three cities and linking them to all relevant material (guidelines, protocols, videos, etc), were continuously updated. Communication materials have taken several formats: <a href="#">interactive guidelines</a>, <a href="#">interactive maps</a> and <a href="#">websites per country</a> were uploaded to illustrate NbS in each of the pilot cities.</p> <p>Three case studies have also been finalized and launched under this reporting period: (1) Financing ecosystem-based adaptation: A case study from Xalapa, Mexico; (2) Gender Justice and resilience of peri-urban female coffee farmers in El Salvador through ecosystem-based adaptation; and (3) EbA solutions for watershed resiliency in urban and peri-urban areas: A case of Latin America and the Caribbean.</p> <p>In the current reporting period, there have been close to 34,100 <b>new</b> users accessing the website, from all 6 regions of the world. The Youtube account has also had an increasing number of subscribers, reaching more than 1,462 subscribers and more than 70,200 different viewers in total. The “<i>Wednesdays of CityAdapt</i>”, virtual seminars to discuss key topics on NbS for urban adaptation, have also continued during the reporting period, coupled with city-level training.</p> <p>The project has been invited to several global events in the current reporting period, including the Smart City Expo in Curitiba (2<sup>nd</sup> largest after the one in Barcelona) and the Nature of Cities Festival 2024. Other events from previous years include the Gobeshona Global Conference, COP27, the World Forestry Congress organized by FAO and UNEP, and the Urban Wetlands events (“A solution for sustainable cities” organized by the University of Los Andes), <a href="#">a G20 session</a>, <a href="#">The Nature of Cities Festival</a>, the <a href="#">15<sup>th</sup> International Conference on Community-based Adaptation (CBA) to climate change</a> and <a href="#">the LAC Climate Weeks</a>.</p> |
|--|--|

|  |  |
|--|--|
| <b>Main learning during the period</b> | The compilation of all project results, including guidelines, protocols, maps of the vulnerability assessments, etc., into the web platform is key for the project sustainability. A dedicated tab was designed for each city, referencing all the different sections of the web platform, and allows the local audience to easily refer to the needed material. |
|--|--|

**2.9. Stories to be shared**

|                             |  |
|-----------------------------|--|
| <b>Stories to be shared</b> | <p>In October 2023, the CityAdapt LAC project won the Kipepeo Award from UN Environment Programme at the global level.</p> <p>Launched in 2021, the Kipepeo Awards recognize teams and projects that have demonstrated exceptional performance and dedication to achieving UNEP’s objectives, the Medium-Term Strategy (MTS) 2022-2025 and the objectives of the Secretariat’s Multilateral Environmental Agreements. It has three categories: innovation, collaborative team, and environmental impact, and it is in this latter group that CityAdapt, together with <a href="#">Shade for Life</a>, stood out among the 16 nominations.</p> <p>The UNEP Kipepeo Awards are inclusive and open to all types of UNEP projects and initiatives. The finalists and winners are selected by three panels that review the nominations under each category. The various aspects of a project are scored with a matrix and points system, and the evaluation panel presents a short list of three candidates for the Executive Director’s consideration.</p> <p>Among all projects implemented by UNEP, CityAdapt LAC won this third edition of the Kipepeo Awards under the environmental impact category, demonstrating its outstanding impact in advancing the environmental agenda at the local, national and regional level, and demonstrating its sustainability and scalability in the region.</p> <p>In May 2024, the Kipepeo Awards themselves were then recognized at the global level, among all UN agencies, winning the Secretary-General Award for 2023 in the category “<a href="#">Staff Recognition and Rewards</a>.” The team received the most votes from across the UN Secretariat (see <a href="#">the congratulatory message from the Secretary-General</a> on iSeek).</p> |
|-----------------------------|--|

### 3. PROJECT PERFORMANCE AND RISK

Based on inputs by the Project Manager, the **UNEP Task Manager**<sup>3</sup> will make an overall assessment and provide ratings of:

- (i) Progress towards achieving the project Results(s)- see section 3.1
- (ii) Implementation progress – see section 3.2

Section 3.3 on Risk should be first completed by the Project Manager. The UNEP Task Manager will subsequently enter his/her own ratings in the appropriate column.

#### 3.1 Rating of progress towards achieving the project outcomes (Development Objectives)

| Project objective and Outcomes  | Indicator  | Baseline level | Mid-Term Target or Milestones <sup>4</sup> | End of Project Target   | Progress as of current period (numeric, percentage, or binary entry)   | Observations/ justification on rating | Progress rating <sup>5</sup> |             |                 |               |                |                        |  |      |                           |  |   |                |               |               |                        |  |      |                           |  |   |                |               |               |                        |  |      |                           |  |   |                    |               |               |                        |  |        |                           |  |   |   |    |
|---|--|----------------|--|---|--|---------------------------------------|------------------------------|-------------|-----------------|---------------|----------------|------------------------|--|------|---------------------------|--|---|----------------|---------------|---------------|------------------------|--|------|---------------------------|--|---|----------------|---------------|---------------|------------------------|--|------|---------------------------|--|---|--------------------|---------------|---------------|------------------------|--|--------|---------------------------|--|---|---|----|
| <b>Objective<sup>6</sup></b><br><br>To reduce the vulnerability of communities living in three medium-sized Latin American and Caribbean cities to the effects of climate change through the integration of Ecosystem-based Adaptation (EbA) into urban planning in the medium- to long-term. | 1.Total number of direct beneficiaries from the project and % of which are women | Zero           | N/A  | At least 98,590 people benefitting from the project (of which at least 50% are women).<br><br>México: 36,590 people in the Carneros watershed, of which 53% women.<br><br>Jamaica: - 8,000 residents (2,500 households, of which ~60% are headed by women) in | Overall progress towards the Objective target stands at 133%. <sup>3</sup> For joint projects and where applicable ratings should also be discussed with the Task Manager of co-implementing agency.

<sup>4</sup> Some projects are adopting/planning to adopt milestones for tracking the achievement of outcomes. Add the corresponding milestones in this column when applicable to inform the rating. Milestones are optional and may substitute for Mid-Term Target.

<sup>5</sup> Use GEF Secretariat required six-point scale system ([GEF/C.52/Inf.06/Rev.01](#)): Highly Satisfactory (**HS**), Satisfactory (**S**), Marginally Satisfactory (**MS**), Marginally Unsatisfactory (**MU**), Unsatisfactory (**U**), and Highly Unsatisfactory (**HU**)

<sup>6</sup> Add rows if your objective has more than 3 outcome indicators. Same applies for the number of outcomes.

|                                | ed by gender). |                |  | <p>trained, of which 50% are women.</p> <p>Jamaica: At least 100 people are trained, of which ~50% are women.</p> <p>El Salvador: At least 40 people are trained, of which ~40% are women.</p> |  | <p>“NbS accelerator” initiative with the Mexican Climate Community, WRI and WWF with 16 subnational teams made up of between 4 and 5 decision-makers each in 2021.</p> <p><u>In Jamaica</u>, 4 additional persons were trained by the Jamaica 4H Clubs, reaching 21 persons trained by that institution, added to the 36 trained in urban EbA by TNC in the previous reporting period. Due to the difficulty of engaging national and local authorities in Jamaica, only a limited number of government staff have been trained and the target was not achieved in that country. However, following the TNC course, a training institutionalization process was carried out with four postgraduate institutions in Kingston, for them to integrate the topic in their core curricula: UWI, the University of Technology, the Management Institute of National Development (MIND) and the Caribbean Centre for Development Administration (CARICAD). Under this reporting period, this was successfully carried out in MIND and UWI-Mona (see <a href="#">training modules</a> and report <a href="#">here</a>).</p> <p><u>In El Salvador</u>, workshops were held with municipalities and decision-makers for the mainstreaming of NbS in urban planning (San Salvador, Nejapa and OPAMSS), with a total of 19 participants in this reporting period.</p> <p>These capacities were built mainly among government officials, decision-makers and municipalities through activities under Output 1.3: <i>Training provided to local government authorities and relevant private sector stakeholders (...) on implementing urban EbA</i>, and Output 1.4: <i>Strategies developed to upscale and sustain EbA interventions</i>.</p> |                              |

The elaboration of new project proposals seeks to involve new municipalities in these processes, integrating the lessons learnt from the project to mainstream climate change adaptation, and EbA approaches in particular, in urban areas beyond the three CityAdapt cities.</p> <p>At the regional level, a proposal based on the CityAdapt project's lessons learnt (Nature4Cities) was approved by the Green Climate Fund (GCF) in January 2021 and is being implemented in 13 cities in Cuba, Ecuador, Honduras and the Dominican Republic, Guatemala, Panama and Uruguay. The Nature4Cities project follows methodologies elaborated by this project, such as the vulnerability assessments, and aims at identifying NbS opportunities and key actors to strengthen selected Latin American cities' climate resilience. The project includes activities that will also benefit cities in EI Salvador, Jamaica and Mexico in 2024, such as a MOOC on NbS in urban areas that will be disseminated to CityAdapt's key stakeholders.</p> <p><u>In Mexico</u>, the concept note "<i>CityAdapt 2.0</i>" was developed for submission to the GCF. The proposal involves 10 cities in Mexico that suffer hydrological stress. The concept note was approved internally in UNEP and is foreseen to be submitted to the GCF with a project preparation funding request once the new government in Mexico takes office (October 2024 onwards). The secured co-financing from the Rio Arronte Foundation (around USD</p> | S |

|                                |           |                |  |                       |  | <p>200,000) is being channelled to develop the climate risk assessments of some of the additional cities (see <a href="#">article</a>).</p> <p><u>In Jamaica</u>, The Nature Conservancy has submitted an upscaling strategy in this reporting period, which can be seen <a href="#">here</a>.</p> <p><u>In El Salvador</u>, several upscaling strategies were carried out. The first one consisted of supporting four municipalities in developing their adaptation planning and identifying NbS measures for adaptation. Capacity building and technical support workshops were held in July 2022 with San Salvador and Nejapa, resulting in plans that integrate NbS into urban planning; see the ones for <a href="#">Antiguo Cuscatlán</a>, <a href="#">San Salvador</a>, <a href="#">Santa Tecla</a> and <a href="#">Nejapa</a>. It is important to note that Nejapa was not included in the project design (no EbA intervention was piloted there), but its inclusion in the process is aligned with recommendation 5.2 of the MTR, on identifying areas of “greatest possible impact”, which Nejapa is considering the interest from local authorities to join the initiative after the 2020 landslide previously reported. The team prepared a series of 6 methodological sheets for the implementation of the upscaling activities, which were used in these 4 workshops on the integration of NbS measures in urban planning (see annexes of the plan <a href="#">here</a>).</p> <p>In addition to the above, the project team also supported the formulation of a proposal “San Salvador in development ... of heat?” submitted with the San Salvador metropolitan area planning office (OPAMSS) for the IADB Cities Laboratory Challenge “Cities for All”. The proposal was selected under the previous period</p> |                              |

|  |   |   |  |   |   | <p>to support funding research on the use of mosses and other species to reduce temperature and improve air quality in San Salvador, thus giving continuity to some of the NbS interventions implemented in the city (see plan <a href="#">here</a>).</p> <p>Finally, under this reporting period, a regional upscaling project was developed for Adaptation Fund financing, together with Guatemala and Honduras – “Building Resilience of Urban Communities in Central America by Leveraging Nature-based Solutions (NbS) for Adaptation”. The proposal builds on the lessons learnt from CityAdapt, planning to upscale its work in San Miguel, La Libertad, and two new municipalities of the San Salvador Metropolitan Area – Soyapango and Ilopango. The preconcept note was <a href="#">approved</a> in March 2023 during AF B-40 and the concept note obtained technical clearance on May 20<sup>th</sup> 2024, with the expected approval in the AF B-43 (October 2024).</p> |                              |                   |               |  |  |                                    |   |         |  |   |   |  |           |

Number of protocols developed to guide implementation of EbA in San Salvador, Kingston and Xalapa | Zero                    | N/A   | At least one set of EbA protocols developed for each pilot city (three in total) | <p>Overall progress towards Outcome indicator 2.2 target stands at 100%.</p> <table border="1" data-bbox="953 435 1375 899"> <thead> <tr> <th>Country</th> <th>Target</th> <th>Addition since last PIR</th> <th>Achievement</th> </tr> </thead> <tbody> <tr> <td><b>Overall:</b></td> <td><b>3</b></td> <td><b>1</b></td> <td><b>3</b></td> </tr> <tr> <td>Mexico:</td> <td>1</td> <td>0</td> <td>1 set (8 protocols)</td> </tr> <tr> <td>Jamaica</td> <td>1</td> <td>1</td> <td>1 set (6 protocols)</td> </tr> <tr> <td>El Salvador</td> <td>1</td> <td>0</td> <td>1 set (13 protocols, 4 translated to English)</td> </tr> </tbody> </table> | Country                               | Target                       | Addition since last PIR | Achievement | <b>Overall:</b> | <b>3</b> | <b>1</b> | <b>3</b> | Mexico: | 1 | 0 | 1 set (8 protocols) | Jamaica | 1 | 1 | 1 set (6 protocols) | El Salvador | 1 | 0 | 1 set (13 protocols, 4 translated to English) | <p>The technical information gathered during the on-the-ground pilot EbA interventions are compiled in a set of protocols. They are used by the beneficiaries (farmers and community members mainly) during implementation, as they were developed based on identified needs of providing appropriate materials for the EbA implementation. They increase adaptive capacity of project stakeholders, providing technical information on how to implement each EbA intervention, how to measure its impact and how to assess its links with ecosystem services and climate change adaptation. In addition, the protocols support the replication and upscaling of the piloted EbA interventions.</p> <p>The protocols produced based on the CityAdapt interventions were harmonized and compiled into a set of 20 protocols <a href="#">in Spanish</a> and 10 <a href="#">in English</a>. They are also uploaded in the webportal with specific NbS tabs that contain a series of technical information on the measures (see <a href="#">here</a>). This standardization ensures urban and peri-urban communities and planners in other municipalities have access to technical information on EbA options.</p> <p>In parallel, in this reporting period, a new series of NbS measures for adaptation in urban settings were listed into a <a href="#">Compendium for NbS in urban areas</a> with a watershed approach, to produce a regional manual detailing the main characteristics of these interventions, that will be used beyond the direct beneficiaries of this project. This document includes NbS that were not implemented by the project, bringing complementary and additional information to the project insights.</p> <p><u>In México</u>, a set of 8 protocols were developed under previous reporting period. See the</p> | S |

Sustainable agriculture practices, such as edible mushrooms plots, beekeeping or coffee restoration, provide alternative productive activities, increase income and promote the diversification of crops so as to increase the crops' resilience.</p> <p>Urban gardens installed in all three cities provide food security and also additional resources and incomes. In Jamaica, three food gardens (including drip irrigation and a post harvesting shed) were installed in Tivoli Gardens High School, Camperdown High and Kingston Technical High, two container gardens were installed at Kingston Technical High School and the St Andrew Technical High School, and one hydroponics system was installed at Tivoli Gardens High School (see <a href="#">report</a>).</p> <p>Mexico also reached all targets in food gardens, and El Salvador exceeded them with an additional one. After the pandemic, some urban gardens installed prior to 2020 needed additional support to recover in El Salvador particularly, where a rehabilitation strategy was developed for 4 of the first 5 school gardens. Impacts from the pandemic were lower in Mexico and Jamaica, although the consequent economic crisis had an impact on materials' purchase and availability of local staff in all three countries.</p> <p>Agricultural start-up kits were delivered with capacity building exercises in most schools in previous reporting periods, with 10 agricultural startup kits delivered in 10 school orchards in selected schools of Xalapa (see video <a href="#">here</a>) and</p> | HS |

|                                |  |                           |  | <ul style="list-style-type: none"> <li>- 10 urban gardens in 10 schools.</li> <li>- 10 agricultural start-up kits at 10 schools in the Arenal Monserrat area.</li> <li>- 450 fruits trees planted in urban communities and coffee plantations.</li> </ul> |   | <p>11 in San Salvador. In addition, an urban agricultural capacity-building strategy was developed in Xalapa together with the Estate Public Education Secretary (See report <a href="#">here</a>). The promoted ownership has led to increased local initiatives, such as in El Salvador, where a community garden run by women from a coffee cooperative was established based on CityAdapt's support. This cooperative was even selected by the Global Commission of Adaptation (GCA) for the Local Adaptation Champions Awards in the Women in Leadership category (see <a href="#">here</a> the GCA article and the video made for the final selection <a href="#">here</a>). This gender-positive initiative is promoted by CityAdapt's actions at the local scale.</p> <p>These interventions are also being monitored to assess agricultural adaptation. The cocoa plants for instance, which grow under specific conditions (under 900 meters above sea level), are used to monitor changes in climate conditions (some of the selected plantations are 1,100 meters above sea level).</p> <p>In Jamaica, 31 additional bee colonies were delivered, reaching the planned total of 250.</p> |                              |                           |             |        |     |   |     |         |  |  |     |         |     |     |     |         |  |  |       |             |     |   |       |  |    |

These beneficiaries have improved their knowledge on climatic risks they are exposed to, and the possible solutions that they can employ to adapt to climate change, giving them better decision-making opportunities to manage their livelihoods as well.</p> <p><u>In Jamaica</u>, under this reporting period 11 persons were trained in container garden management (91% women) and 67 participants in urban EbA from all the targeted schools (57% women), added to the previously reported 37 persons trained in the maintenance of RWHS (78% women) and 25 trained in the maintenance of irrigation systems (76% women). In addition, 25 university students of architecture were involved in a training on EbA (see report <a href="#">here</a>). As for the beekeeping target, 10 additional persons were trained, reaching a total of 35 (56% women).</p> <p><u>In El Salvador</u>, in previous reporting periods, students and local government members from the agroecology department acquired knowledge on best practices, benefits and co-benefits of urban food gardens and water harvesting systems. Capacities have also been enhanced on the implementation of urban gardens, infiltration ditches and absorption wells with local cooperative members and farmers from coffee plantations. In times of the pandemic, due to the closure of schools, the 5 orchards installed in 2019 were abandoned. The project developed a</p> |                              |

|   |  |                |  |  |  | rehabilitation strategy, consulting again with the educational community. 4 of these schools agreed to participate with new students in the recovery of the school garden through training. This recovery was made in Q3 and Q4 2022.   |                              |          |                           |                           |             |                 |          |          |          |   |  |         |          |   |  |                   |                      |                |          |          |          |                                     |  |     |         |          |  |     |     |         |  |     |     |           |  |     |    |                |          |          |          |                                     |  |         |         |                                   |  |          |          |                    |          |          |          |                |  |     |        |
| <b>Outcome 3</b><br><br>Knowledge and awareness of urban EbA interventions strengthened in El Salvador, Jamaica and Mexico, and throughout the LAC region | 1. Number of communication strategies for urban EbA developed. | Zero           | N/A  | One communication strategy developed for each city (three in total) with specific guidelines for targeting different groups. | Overall progress towards Outcome indicator 3.1 target stands at 100%.  | In this reporting period, knowledge and awareness on urban EbA were consolidated at the regional level and had a particular impact in Jamaica through the implementation of the national communication strategy. In Kingston, the installation of demonstration signs at each pilot intervention (see <a href="#">report</a> ), the elaboration of project brochures with the different partners (see <a href="#">here</a> ) and collaboration with the social media of each implementing partner served to expand the visibility of the project in its last months of implementation. Participation in TV programmes and publication of articles in the national newspaper The Gleaner also ensured a wider audience reach (see report on project visibility in Jamaica <a href="#">here</a> ).<br><br>The project continued to increase its regional impact through the ever-on-going development of its web platform, with quality products such as the NbS guidelines, thematic webinars and technical publications, being consulted and downloaded from across the LAC region, as highlighted by recommendation 6 of the MTR. Under this reporting period, one tab was created in the project website for each country of implementation, to serve as a repository of the main deliverables produced at the local level – see the tabs for <a href="#">El Salvador</a> , <a href="#">Mexico</a> and <a href="#">Jamaica</a> .<br><br>This is in addition to the material uploaded in the different sections of the web platform.<br><br>In previous reporting periods, the regional communication strategy was completed, with the | S                            |          |                           |                           |             |                 |          |          |          |   |  |         |          |   |  |                   |                      |                |          |          |          |                                     |  |     |         |          |  |     |     |         |  |     |     |           |  |     |    |                |          |          |          |                                     |  |         |         |                                   |  |          |          |                    |          |          |          |                |  |     |        |

|                                |   |                |  |  | through social media  |               |                                  | national strategies of Mexico ( <a href="#">here</a> ) and El Salvador ( <a href="#">here</a> ), and Jamaica ( <a href="#">here</a> ). Specific communication strategies were put in place for each intervention. Promotional materials (water bottles, t-shirts, caps, rain jackets, pens, magnets) delivered during implementation are also key in raising awareness on urban EbA – 1,200 people have been reached through this approach in El Salvador (200 additional since last reporting period). This approach was also implemented in Jamaica, reaching 875 beneficiaries with the distribution of notepads, notebooks, water bottles, drawstrings bags and press kits, and also reaching some 2,333 beneficiaries in previous reporting periods in Mexico with similar materials. |                              |                    |

## 4. Risk Rating

### 4.1 Table A. Project management Risk

Please refer to the **Risk Help Sheet** for more details on rating.

| Risk Factor  | EA's Rating | TM's Rating |
|--|-------------|-------------|
| 1. Management structure – Roles and responsibilities | M           | M           |
| 2. Governance structure – Oversight                  | L           | L           |
| 3. Implementation schedule                           | M           | M           |
| 4. Budget  | L           | L           |
| 5. Financial Management                              | L           | L           |
| 6. Reporting   | L           | L           |
| 7. Capacity to deliver                               | M           | M           |

### 4.2 Table B. Risk-Log

| Risk  | Risk affecting:        | Variation respect to last rating |       |       |       |       |       |       |       |   | Justification  |
|---|------------------------|----------------------------------|-------|-------|-------|-------|-------|-------|-------|---|--|
|   | Outcome / outputs      | CEO ED                           | PIR 1 | PIR 2 | PIR 3 | PIR 4 | PIR 5 | PIR 6 | PIR 7 | Δ |  |
| 1. National Coordinators and stakeholders at the national level have a limited overview of the overarching project objectives because of the project's multi-faceted, multi-country nature. | All outcomes & outputs | M                                | N/A   | M     | M     | L     | L     | L     | L     | = | The last year of the project demonstrated a clear vision of the expected impacts and goal of the CityAdapt. Regional products such as the UNEP publication on urban NbS, the compendium, and the web platform helped to consolidate the regional approach. Regular coordination and exchange calls maintained the dialogue space between the different teams – both technical, communication and administrative. |
| 2. Poor coordination among project stakeholders because of language and geographical barriers.  | All outcomes & outputs | M                                | N/A   | M     | M     | L     | L     | L     | L     | = | Formal and informal communication and reporting functions between national and regional committees are undertaken in both English and Spanish. The online web platform continues to serve as a key tool to share knowledge and experiences beyond project implementation.  |

| Risk  | Risk affecting:        | Variation respect to last rating |       |       |       |       |       |       |       |   | Justification   |
|---|------------------------|----------------------------------|-------|-------|-------|-------|-------|-------|-------|---|---|
|   | Outcome / outputs      | CEO ED                           | PIR 1 | PIR 2 | PIR 3 | PIR 4 | PIR 5 | PIR 6 | PIR 7 | Δ |   |
| 3. Natural disasters undermine the implementation of the EbA interventions (leading to economic loss and/or damage to the interventions).                                   | Outcome 2              | H                                | N/A   | N/A   | M     | ML    | M     | M     | S     | ↑ | <p>Landslides occurred in San Salvador in October and November 2020 but have not had direct impact on the project interventions. In 2021, new records of rainfall were reached in San Salvador (4mm/min), causing flooding, damages and economic losses in the city, but not directly to the project interventions. In Xalapa, in August 2021, hurricane Grace caused flooding and landslides, but did not have a direct impact on the project interventions.</p> <p>In 2023, with El Niño, drought hit all three countries, with delayed rainy seasons in El Salvador and reduced rainfall in Jamaica, that caused delayed in the reforestation activities and increased mortality of plants, as well as additional maintenance needs.</p> <p>The return of La Niña in 2024 meant increased rainfall. In Xalapa, this allowed to witness the proper functioning of the restored natural wetland (see <a href="#">here</a>). However, the passage of hurricane Beryl in Jamaica, the earliest Hurricane 5 ever monitored in the Caribbean, that formed on June 28<sup>th</sup> 2024, is being anticipated as a source of destruction, with early reporting of floods of the bee hives distributed by the project and school gardens. Monitoring will have to determine whether the project interventions survive its passage.</p> |
| 4. Limited inter-sectoral data sharing.   | All outcomes & outputs | M                                | N/A   | L     | L     | L     | L     | L     | L     | = | The use of open data is being maximized to minimize problems with data sharing. All the maps from the climate risk assessments were uploaded in the project web platform to guarantee their availability beyond the project time frame.   |
| 5. High turnover of staff in implementing agencies (leading to reduced institutional memory resulting in disruptions or delays in project implementation and coordination). | All outcomes & outputs | H                                | N/A   | N/A   | M     | S     | S     | S     | M     | ↓ | New elections took place in all three countries under this reporting period, implying some staff turnover at the local and national level. This was particularly felt in Mexico and Jamaica at the national level, where focal points in the ministries were replaced and contact was hard to   |

| Risk  | Risk affecting:        | Variation respect to last rating |       |       |       |       |       |       |       |   | Justification   |
|---|------------------------|----------------------------------|-------|-------|-------|-------|-------|-------|-------|---|---|
|   | Outcome / outputs      | CEO ED                           | PIR 1 | PIR 2 | PIR 3 | PIR 4 | PIR 5 | PIR 6 | PIR 7 | Δ |   |
|   |                        |                                  |       |       |       |       |       |       |       |   | <p>establish with the new teams. Closeness to the MARN in EI Salvador mitigated this issue to a certain point.</p> <p>Support was sought from other agencies, such as the National Environmental and Planning Agency in Jamaica, who are part of the Technical Committee and the Forestry Department, an Agency of the Government that assisted with implementing some project interventions, as well as the state government in Mexico.</p> <p>With the end of the project, turnover in implementing partner staff, especially in FUNDASAL (EI Salvador) and Jamaica 4H Clubs (Jamaica) also hindered ownership and delayed the finalization of project activities. All partners put in place mechanisms and mobilized other staff to ensure completion of products. Some activities' scope was however changed to reinforce capacity building and knowledge management and ensure the EbA interventions are properly implemented, monitored and produce expected and measurable impact.</p> <p>Despite the previous turnover in all three countries, that resulted in delay in implementation and loss of capacity and ownership of the issues, all activities were completed as planned.</p> |
| 6. Government will have insufficient funds to sustain the local structures <sup>10</sup> , once the project ends (leading to limited upscaling of the urban EbA interventions). | All outcomes & outputs | M                                | N/A   | N/A   | M     | ML    | M     | M     | M     | = | <p>In Mexico, an exit strategy was developed that has managed to identify and direct funds for the continuity of the monitoring and evaluation process, as well as funds to scale up the project, see document <a href="#">here</a>. This complements the previously reported additional funding leveraged for the installation of rainwater harvesting systems, and the development of a 2% voluntary contribution from the water bills to ensure maintenance and monitoring of the sites. The risk remains the same considering the mechanism was halted by the new mayor, some of the funds are still operational</p>  |

<sup>10</sup> Local structures include for example the research programmes and EbA projects to be implemented under the existing climate change units/committees.

| Risk   | Risk affecting:        | Variation respect to last rating |       |       |       |       |       |       |       |   | Justification  |  |
|--|------------------------|----------------------------------|-------|-------|-------|-------|-------|-------|-------|---|--|--|
|  | Outcome / outputs      | CEO ED                           | PIR 1 | PIR 2 | PIR 3 | PIR 4 | PIR 5 | PIR 6 | PIR 7 | Δ |  |  |
|  |                        |                                  |       |       |       |       |       |       |       |   |  | <p>and the situation could change over the course of the next months.</p> <p>In El Salvador, the risk also remains the same, with limited Ministry of Environment budget that diminishes its follow-up capacity.</p> <p>In Jamaica, the Forestry Department had committed some of its own funding for maintenance of project sites for some years. The partnership with 4H Clubs also implies that the “club” network will continue to support certain beneficiaries (especially schools) beyond project implementation.</p> |
| 7. The implementation of the EbA interventions is undermined by social unrest within the target communities (leading to delays in project activities). | Outcome 2              | M                                | N/A   | N/A   | L     | L     | M     | L     | L     | = | <p>No social unrest has been reported under this reporting period, and general ownership of the interventions has been accomplished in all three cities.</p> <p>While political change was followed by violent outbreaks and political tensions in El Salvador, that slowed the implementation of certain activities by the implementing partners in 2021, the situation has settled down since and no major violent outbreak is to be reported. In Jamaica, several interventions were implemented in low-income communities with general security issues. However, after the previously reported thefts of equipment and materials at some intervention sites, mitigation actions were taken, including obtaining more support from the school directors and changing some interventions sites. No major issue was reported under this reporting period.</p> <p>With the finalization of interventions in all three countries, the risk remains low.</p> |  |
| 8. Unsustainable land and natural resource use (leading to further degradation of ecosystems).   | All outcomes & outputs | H                                | N/A   | N/A   | M     | ML    | M     | M     | L     | ↓ | <p>In Mexico, the water commission of Xalapa City signed an agreement to conserve 1,564 hectares of forest that provides water to the city under the previous reporting period. This agreement ensures the payment for ecosystem services until 2028.</p>  |  |

| Risk  | Risk affecting:        | Variation respect to last rating |       |       |       |       |       |       |       |   | Justification  |
|---|------------------------|----------------------------------|-------|-------|-------|-------|-------|-------|-------|---|--|
|   | Outcome / outputs      | CEO ED                           | PIR 1 | PIR 2 | PIR 3 | PIR 4 | PIR 5 | PIR 6 | PIR 7 | Δ |  |
|   |                        |                                  |       |       |       |       |       |       |       |   | <p>In El Salvador, the close work with the OPAMSS (Planning Organization for the Metropolitan Area of San Salvador) has led to the mainstreaming of NbS in urban planning, as well as the drafting of specific plans for 4 of these municipalities, expecting that these results can diminish land and natural resources degradation on the long term.</p> <p>In Jamaica, the guideline on urban planting was elaborated in close collaboration with the Forestry Department, which included it as a new mandate of work in the city area. The sustainable drainage system guideline was also drafted with the Ministry of Public Works, expecting some collaboration to progressively include green or hybrid infrastructure in their plan of work. These are positive results that would encourage ecosystem restoration and rehabilitations.</p> <p>The risk remains low as the project ends and NbS have been implemented, although unsustainable use of natural resources, especially water-use planning without NbS focus, could never have been fully mitigated by the project.</p> |
| 9. Local zoning and land use plans compete with EbA interventions (undermining their efficacy). | All outcomes & outputs | H                                | N/A   | N/A   | M     | L     | L     | L     | L     | = | National Steering Committees include municipal representative, and consultation processes conducted for the elaboration of the vulnerability assessments ensure coordination with authorities. EbA interventions were mainstreamed into urban development planning to avoid competition with other land use plans. The risk remains low.   |
| 10. Large-scale infrastructure development in the cities during implementation                  | All outcomes & outputs | M                                | N/A   | N/A   | L     | L     | L     | L     | L     | = | Demonstration of EbA activities' benefits and co-benefits allows to limit possible large-scale grey infrastructure impact on the project, as was the case in San Salvador and in Kingston. In the long-run, the 2% voluntary contribution from the water bills in Xalapa also intends to diminish the investment in large-scale grey infrastructure, through the insights provided by the new commission and the interventions to be undertaken at the watershed-level   |

| Risk  | Risk affecting:        | Variation respect to last rating |       |       |       |       |       |       |       |   | Justification |   |
|---|------------------------|----------------------------------|-------|-------|-------|-------|-------|-------|-------|---|---------------|---|
|   | Outcome / outputs      | CEO ED                           | PIR 1 | PIR 2 | PIR 3 | PIR 4 | PIR 5 | PIR 6 | PIR 7 | Δ |               |   |
|   |                        |                                  |       |       |       |       |       |       |       |   |               | to conserve the ecosystems and the water provision. No major issues were reported on this risk under this reporting period.   |
| 11. Potentially significant delays in the implementation of certain project activities can be expected due to COVID-19 related restrictions on travel, social distancing / quarantine requirements, unavailability of partners and stakeholders, and delays in administrative (including procurement and permit/authorization) processes due to prioritization of COVID-19 response by the government and stakeholders. | All outcomes & outputs | N/A                              | N/A   | N/A   | M     | M     | M     | L     | L     | = |               | Most countries went back to a “business as usual scenario” since 2023 with limited impact from COVID-19 to report on since 2022. Schools reopened for local activities, and rescheduling of project activities thanks to the second no-cost extension permitted to adapt project implementation schedule to these previous impacts.   |
| 12. There are large variations in capacity and engagement between the three countries / cities, which is reflected in different levels of progress between the three cities, and is likely to result in different levels of target achievement and quality.   | All outcomes & outputs | N/A                              | N/A   | N/A   | M     | M     | M     | M     | L     | ↓ |               | Mexico and El Salvador did complete most project implementation under the previous reporting period, but Jamaica also managed to finish all activities under this reporting period. Only 1 target was not met in Kingston, regarding the number of government staff trained, but this risk was identified and acknowledged since 2022, with other targets adjusted as required. While impacts vary greatly among the different cities, knowledge management and capacity building of the implemented activities was a priority and, under this reporting period, the project completed all activities as planned.   |
| 13. Administrative delays with legal agreements, registration of partners and long delays in processing payments to partners  | All outcomes & outputs | N/A                              | N/A   | N/A   | M     | M     | L     | L     | M     | ↑ |               | While implementation was completed in El Salvador and Mexico, and most activities in Jamaica were implemented, the 2nd payment under the Jamaica 4H Clubs was delayed by almost 7 months (requested in November 2023 and received by the partner in May 2024). This was due to two independent issues of cash replenishment and updates in the payment system (UMOJA), resulting in a high impact in Kingston. The partner has now received the payment and is finalizing all outstanding payments to close up the agreement. Only one last payment is due under the project to that partner, expected in Q3 2024, and the project is now under the operational closure period. |

| Risk  | Risk affecting:        | Variation respect to last rating |       |       |       |       |       |       |       |   | Justification  |
|---|------------------------|----------------------------------|-------|-------|-------|-------|-------|-------|-------|---|--|
|   | Outcome / outputs      | CEO ED                           | PIR 1 | PIR 2 | PIR 3 | PIR 4 | PIR 5 | PIR 6 | PIR 7 | Δ |  |
| 14. The overarching project approaches are not fully understood or internalized by national or local stakeholders | All outcomes & outputs | N/A                              | N/A   | N/A   | N/A   | N/A   | L     | L     | L     | = | This challenge was mitigated in San Salvador and Xalapa through substantial increase in the level of coordination among institutions, data sharing and understanding of the concept of EbA. In Kingston, the project developed several trainings for different beneficiaries, targeting both decision-makers through TNC's scope of work, as well as academia, schools and direct beneficiaries under 4H Clubs' work. Capacity building on the role of EbA in adaptation in cities and learning-by-doing exercises are integral approaches in project implementation. The regional coordination team also supported extensive knowledge- and experience-sharing between the cities to help overcome the challenges encountered. With the closure of the project and most activities implemented, this risk is low. |
| Consolidated project risk   |                        | N/A                              | M     | M     | M     | M     | M     | M     | M     | = |  |

#### 4.3. Table C. Outstanding Moderate, Significant, and High risks

| Risk  | Actions decided during the previous reporting instance (PIR <sub>t-1</sub> , MTR, etc.)  | Actions effectively undertaken this reporting period   | Additional mitigation measures for the next periods  |            |                           |
|---|--|--|--|------------|---------------------------|
|   |  |  | What   | When       | By whom                   |
| 3. Natural disasters undermine the implementation of the EbA interventions (leading to economic loss and/or damage to the interventions). | The reduced rainfall and drought situation in El Salvador and Jamaica in particular affected restoration and planting activities. In the case of El Salvador, a no-cost extension had to be signed with PROCOMES to ensure proper finalization of activities, while in Jamaica, the Forestry Department committed funding for additional planting and maintenance. | <p>All restoration and reforestation activities were finalized in all three countries, and therefore no additional measures are required.</p> <p>In Mexico, see the exit strategy <a href="#">here</a> with the list of the institutions in charge of the maintenance of the project's restoration and reforestation activities.</p> <p>In Jamaica, the Forestry Department is in charge of the maintenance of the project's restoration/reforestation activities.</p> | Monitoring of the project interventions will be carried out by beneficiaries, implementing partners and government staff, using available resources to restore and maintain the implemented NbS. | Continuous | The implementing partners |

| Risk  | Actions decided during the previous reporting instance (PIR <sub>t-1</sub> , MTR, etc.)   | Actions effectively undertaken this reporting period   | Additional mitigation measures for the next periods   |                            |   |
|---|---|--|---|----------------------------|---|
|   |   |  | What  | When                       | By whom   |
|   |   | In El Salvador, PROCOMES and the coffee cooperatives provide continuity to these activities.   |   |                            |   |
| 5. High turnover of staff in implementing agencies (leading to reduced institutional memory resulting in disruptions or delays in project implementation and coordination). | <p>Representatives from the National counterparts participated in the final Steering Committee meetings to ensure institutional memory is kept and they have been engaged in the upscaling strategies in both countries.</p> <p>In Jamaica, to respond to the turnover in the Climate Change Division, support was sought from other agencies, such as the National Environmental and Planning Agency and the Forestry Department.</p> <p>The turnover in the IPs was mostly disruptive in FUNDASAL, TNC and 4H Clubs, resulting in some delays in activities while new staff were hired or mobilized from other parts of the organizations. Close accompaniment and support were provided to the new teams to ensure their comprehension of the project and its activities. In two cases, consultants were directly hired by UNEP and taken out of 4H's agreement. There was no major turnover to note in FGM, PROCOMES, or the Forestry Department.</p> | <p>Despite the turnovers in all three countries, all the project activities were concluded.</p> <p>In Jamaica, coordination with the Caribbean office, the new team from the Climate Change Division and the Planning Institute of Jamaica led to some constructive meetings until December 2023. The Jamaica 4H Clubs presidency was also mobilized to ensure continuity with the Ministry of Agriculture.</p> <p>The project web platform will serve as a repository for all project information, with 1 tab per country that includes all the information developed in each city, thus allowing access to future government staff to project results.</p> | This final report will be shared with PIOJ and MEGJC in Jamaica. Coordination will continue through the UNEP Caribbean office in Kingston if need be. | Q3 2024 onwards            | UNEP sub-regional office for the Caribbean and TNC                |
| 6. Government will have insufficient funds to sustain the local structures <sup>11</sup> , once the project ends (leading to  | In Mexico, the exit strategy identifies funds for the continuity of the monitoring and evaluation process, as well as funds to scale up the project. In Xalapa and San Salvador,  | All activities were completed in all three countries. The exit strategies developed for all three cities identify possible sustainable pathways, and the upscaling strategies were drafted to include  | Actors identified in the exit strategy and upscaling strategies of each country will be responsible for implementing the proposed                     | In the medium to long-term | Diverse range of actors identified in the exit strategies, mainly |

<sup>11</sup> Local structures include for example the research programmes and EbA projects to be implemented under the existing climate change units/committees.

| Risk   | Actions decided during the previous reporting instance (PIR <sub>t-1</sub> , MTR, etc.)  | Actions effectively undertaken this reporting period  | Additional mitigation measures for the next periods  |                   |  |
|--|--|---|--|-------------------|--|
|  |  |   | What   | When              | By whom  |
| limited upscaling of the urban EbA interventions).   | <p>clear roles were distributed to beneficiaries and project stakeholders to ensure most activities are maintained.</p> <p>In Jamaica, the Forestry Department committed some of its own funding for maintenance of project sites for some years.</p>  | continuity to the NbS implemented in all three cities. Trainings in Jamaica were performed to ensure local beneficiaries had the knowledge to maintain the interventions.   | strategies to provide continuity to the interventions.   |                   | implementing partners of the project (NGOs) and local and national authorities |
| 13. Administrative delays with legal agreements, registration of partners and long delays in processing payments to partners | At the UNEP regional office (EA), new administrative assistants were hired to support the team under previous reporting periods, in line with recommendation 10 of the MTR. No major delays have been reported during the current reporting period, but the issue remains a high priority for the coordination team. | Coordination with both UNON and NY was needed to tackle the issue with cash replenishment, that affected both the payment to Jamaica 4H Clubs and the payment to project consultants. Coordination with UNON was then sought to solve the second issue related to the 2nd payment to Jamaica 4H Clubs, that was linked to an error in the implementing partner's details in UMOJA. Constant communication with the local stakeholders in Jamaica was put in place to identify the impact. | Close coordination between UNEP LAC office and HQ office to follow up on payment issues. Close coordination with Jamaica 4H Clubs to ensure the last payment is disbursed in time. | Until end of 2024 | UNEP finance team  |

**High Risk (H):** There is a probability of greater than 75% that assumptions may fail to hold or materialize, and/or the project may face high risks.  
**Significant Risk (S):** There is a probability of between 51% and 75% that assumptions may fail to hold and/or the project may face substantial risks.  
**Moderate Risk (M):** There is a probability of between 26% and 50% that assumptions may fail to hold or materialize, and/or the project may face only modest risks.  
**Low Risk (L):** There is a probability of up to 25% that assumptions may fail to hold or materialize, and/or the project may face only modest risks.

## 5. Project Minor Amendments

### 5.1 Table A: Listing of all Minor Amendments

- |  |   |
|--|---|
| <input checked="" type="checkbox"/> Results framework                  | <input type="checkbox"/> Minor project objective change             |

|                         |   |
|-------------------------|---|
| <b>Minor amendments</b> | <p><b>Minor amendments in previous reporting period:</b></p> <p><b><u>Implementation schedule</u></b></p> <ul style="list-style-type: none"> <li>Two no-cost extensions were requested by the Executing Agency, UNEP Office for Latin America and the Caribbean, for a total of 26 additional months and granted by the Implementing Agency, UNEP Ecosystems Division. Project duration was thus amended from October 2017 until December 2023.</li> </ul> <p><b><u>Location of project activities</u></b></p> <ul style="list-style-type: none"> <li>In Mexico, the artificial wetland initially planned at the Telesecundaria School Rafael Hernández Ochoa, was installed at the Instituto Tecnológico Superior de Xalapa (Outcome 2, indicator 3).</li> <li><b>In Jamaica</b>, the wetlands rehabilitation target stipulated 2 ha to be rehabilitated in Greenwich town. Based on assessment by the FD there is no longer a need for the mangroves in the stated area to be restored, thus the target has been shifted to restoration of 2 ha in Port Royal, Kingston.</li> <li><b>In Jamaica</b>, the target of fruit trees planted in schools has been adjusted to reflect fruit trees planted in schools and <i>community spaces</i> based on the assessment of the FD. The schools are not able to accommodate all the trees; thus, some were also planted in other community spaces.</li> </ul> <p><b><u>Revisions made to the Results Framework</u></b></p> <p><b>Objective</b></p> <ul style="list-style-type: none"> <li><b>The target of beneficiaries in El Salvador</b> was reduced from 115,500 (the whole micro-watershed population) to 20,000 people, to reflect direct beneficiaries from project interventions.</li> </ul> |
|-------------------------|---|

- As a result, the target for **total project beneficiaries** was reduced from 194,090 to 98,590.

**Outcome 2. Indicator 1.**

El Salvador

- Two new targets were added: 3 roundabouts revegetated and 3 rain gardens installed. These are the proposed and approved alternatives to the decrease in riparian restoration target (from 16km to 5km) previously reported.
- The target of 16 kilometres of riparian forest restored along 4 ravines (4 kilometres each) was revised to 5.22 km as a result of an assessment identifying only 5.2 km available for intervention.

Jamaica

- The permeable pavement activity was removed (2,500 square meters of permeable pavements in Kingston) due to capacity, time and budget constraints. Limited time for proper planning and implementation, as well as lack of a clear plan for impact measurement or avoidance of maladaptation from the project partner, coupled with the lack of clear engagement with potential beneficiaries resulted in the replacement of this activity by 1 additional urban garden, 1 container garden and 1 hydroponic infrastructure with schools and institutions already engaged in the project.
- **Number of hectares to be restored** has been reduced from 44,000 hectares to a suggested 12 hectares. This is being suggested as the original target includes a corresponding 4,200 trees to be planted over the 44,000 hectares (the original target of 44,000 ha was erroneous). Based on reports from the Forestry Department (FD) for the purpose of reforestation of forests, 625 seedlings are planted per hectare. This would mean that 4,200 seedlings could cover only 6.72 hectares. According to the second progress report from the FD, 8.96 ha have been restored with 5,600 seedlings. Under the previous agreement with the Jamaica 4H clubs, 3.4 ha was also restored with 2,500 seedlings by the FD. Thus, a total of 7,500 trees over 12 hectares is being suggested as the new target.
- For the **permeable pavements** target, it was written as 2,500 m, the Jamaica 4-H clubs suggested that this be adjusted to be 2,500 square metres as the intervention will cover a two-dimensional area.
- 500 m of **dykes** have been removed – the need for same is not evident; any further interventions will be informed by the vulnerability assessment currently underway.
- A target has been added to reflect the planting of **500 ornamental trees** in schools and community spaces. This was proposed and has been completed by the FD.

Mexico

- The targets of 2.8 km of infiltration ditches and 1.67 km of berms built were adjusted to 1 set of infiltration garden  
The targets of 0.20 km connectivity corridor between EbA action gardens built, 2 km of linear park, and 2 km of concentric circuits, one for cycling and one for walking, were revised to 10 ha of soil restoration in the Estropajo Hill, 7 ha of agroforestry best practices implemented

**Outcome 2. Indicator 3.**

El Salvador

- The target of 30 water storage points was revised to 30 infiltration wells.

Jamaica

- **Detention ponds** have been removed – the need for same is not evident. Any further interventions will be informed by the vulnerability assessment currently underway.

**Outcome 2. Indicator 5.**

El Salvador

- The following target was added: 450 fruit trees planted in urban communities

Jamaica

- Three new targets were added to implement 1 additional urban garden, 1 container garden and 1 hydroponic infrastructure.

|  |  |
|--|--|
|  | <ul style="list-style-type: none"> <li>The target of one <b>beekeeping</b> unit in a community garden was adjusted to include 250 beekeeping colonies. This change resulted from an assessment of land availability and consultations, in order to involve local farmers and increase the impact of this resilient livelihood alternative. The colonies will be implemented both in urban and rural areas, resulting in a comparative assessment of EbA interventions.</li> <li>The target of 1 <b>community garden</b> has been removed based on assessment done by the 4H clubs, which does not see this target as sustainable and feasible. Alternative interventions are being considered (including a container garden) and will be selected based on information from the vulnerability assessment.</li> </ul> |
|  | <p><u>Mexico</u></p> <ul style="list-style-type: none"> <li>The mushroom plot activity was reduced from 20 to 10 as a result of an evaluation showcasing the lack of ownership from local stakeholders and the difficulty of edible mushrooms markets This was approved by the technical committee, redirecting the funds to the targets listed above.</li> <li>The target of 8 agricultural start-up kits at 8 schools was increased to 10 agricultural start-up kits at 10 schools.</li> <li>The target of 15 hectares under agrosilvopastoral management was added as an alternative livelihood activity.</li> </ul>  |

### 5.2 Table B: History of project revisions and/or extensions

| Version                   | Type      | Signed/Approved by UNEP | Entry into Force (last signature Date) | Agreement Expiry Date | Main changes introduced in this revision |
|---------------------------|-----------|-------------------------|--|-----------------------|--|
| Original legal instrument | ICA       | 13 April 2017           | 13 April 2017                          | 30 April 2022         | N/A                                      |
| Amendment 1               | Extension | 29 June 2021            | 13 July 2021                           | 30 June 2023          | 14 months no-cost extension              |
| Amendment 2               | Extension | 22 July 2022            | 02 August 2022                         | 31 December 2024      | 12 months no-cost extension              |

## 6. GEO Location Information:

The Location Name, Latitude and Longitude are required fields insofar as an Agency chooses to enter a project location under the set format. The Geo Name ID is required in instances where the location is not exact, such as in the case of a city, as opposed to the exact site of a physical infrastructure. The Location & Activity Description fields are optional. Project longitude and latitude must follow the Decimal Degrees WGS84 format and Agencies are encouraged to use at least four decimal points for greater accuracy. Users may add as many locations as appropriate. Web mapping applications such as [OpenStreetMap](#) or [GeoNames](#) use this format. Consider using a conversion tool as needed, such as: <https://coordinates-converter.com> Please see the Geocoding User Guide by clicking [here](#)

| Location Name<br>Required field            | Latitude<br>Required field | Longitude<br>Required field | Geo Name ID<br>Required field if the location is not an exact site | Location Description<br>Optional text field | Activity Description<br>Optional text field |

**THIS SECTION IS FOR INTERNAL PURPOSES ONLY AND WILL NOT BE INCLUDED IN THE DISCLOSED PIR REPORT**

## 7. INTERNAL EXECUTION

This section is pursuant to UNEP approved Accountability Framework for Directly Executed GEF Projects AND its Operational Guidelines.

### 7.1 Execution Details

|   |  |
|---|--|
| Is this an internally executed project?                       | Yes  |
| What internal execution modality?                             | Full internal execution                    |
| Legal Instrument  | Internal Cooperation Agreement (ICA)       |
| Name of Executing Unit, Branch, & Division or Regional Office | Office for Latin America and the Caribbean |

### 7.2 Segregation of duties

|   |  |
|---|--|
| Have there been any changes to the reporting lines of personnel at IA-EA functions (organigram)?                              | Yes  |
| If yes, explain the changes clearly reflecting the roles and responsibilities within the division between IA and EA functions | <p>The changes that occurred under previous reporting period are linked to UNEP's New Delivery Model and its distinct implications for the office for Latin America and the Caribbean.</p> <p>In terms of the technical team, it should be noted that:</p> <ol style="list-style-type: none"> <li>1- Until 31<sup>st</sup> March 2023, the project regional coordinator's FRO was the Sub-programme Coordinator, that is the Climate Change coordinator for the LAC region, Gustavo Mañez.</li> <li>2- All the technical project team, including the national coordinators and different technical staff, report to Marta Moneo, regional coordinator.</li> <li>3- On January 1st 2023, Gustavo Mañez was temporarily appointed as Country Representative for the Brazil Office and his role was temporarily covered by Piedad Martín, Deputy and Regional Representative for the LAC Office. Piedad Martín was then appointed as Deputy to the PPD, leaving her position vacant. Juan Bello, Director and Regional Representative, is still in a temporary function under his role.</li> <li>4- According to the New Delivery Model requirements, Marta Moneo's new reporting line should be shifted to the Ecosystem Division (Jessica Troni as Head of CCAU).</li> <li>5- In this situation, both the Task Manager located at CCAU and the Project Manager located at LACO would have the same FRO.</li> </ol> <p>In terms of the financial team, it should be noted that:</p> <ol style="list-style-type: none"> <li>6- The LACO FMO, María Carolina Chiappara, now has Sonja Leighton Kone from CSD as SRO. This shift was implemented on March 31<sup>st</sup>, 2023, as until then, both her FRO and SRO were in LACO.</li> </ol> |

|           |                             | IA                  | EA   |
|-----------|-----------------------------|---------------------|--|
| Programme | <b>Task/Project Manager</b> | Anna Kontorov       | Marta Moneo                                |
|           | <b>FRO</b>                  | Jessica Troni       | Gustavo Mañez (until 31/03/2023)           |
|           | <b>SRO</b>                  | Mirey Atallah       | Piedad Martín (until 31/03/2023)           |
| Finance   | <b>FMO</b>                  | Bwiza Wameyo-Odemba | Maria Carolina Chiappara                   |
|           | <b>FRO</b>                  | Paul Vrontamitis    | Piedad Martín (until 31/03/2023)           |
|           | <b>SRO</b>                  | Annie Muchai        | Sonja Leighton-Kone (until September 2023) |

### 7.3 Reporting

|  |     |
|--|-----|
| <b>Have all reports (finance and progress) been submitted to the GEF Unit?</b> | Yes |
| If not, what reports have not been submitted and why?                          |     |
