

## Theory of Change

The project's theory of change is based on interplay amongst its four components: Outcome 1 will create an enabling environment to support transforming capacities to integrate sustainable conservation management into decision making policies and frameworks. Outcome 2 will ensure that policies and frameworks also include avoiding degradation and biodiversity loss to enable ecosystem functions to be restored. Outcome 3 will strengthen the transition of land management by widely disseminating information, lessons learned and demonstrators for nature based solutions in land management. Outcome 4 will ensure the project results can be scaled up through capacity building and knowledge management.
